Parental separation in childhood and adult inflammation: The importance of material and psychosocial pathways ☆

Rebecca E. Lacey, Meena Kumari, Anne McMunn

Department of Epidemiology & Public Health,
University College London, United Kingdom
Department of Epidemiology & Public Health,
University College London, United Kingdom

CRP levels (correlated with type II diabetes, coronary heart disease, depression...) are increased in children of divorced couples

Conclusions: Parental separation increases CRP in adulthood via chains of disadvantage across the life course. **The study points towards potential points for intervention and highlights a need to support separating families in order to minimize the long-term impact on adult health.**

Journal of Psychiatric Research
Volume 47, Issue 5, May 2013, Pages 604–610

**Association of elevated cytokines with
childhood adversity in a sample of healthy
adults**

Karen J. Hartwell ,Megan M. Moran-Santa,Maria Waleed O. Twal
Stephanie Shaftman
Stacia M. DeSantis
Aimee L. McRae-Clark

Importantly, this association was found in
healthy adults, suggesting that these
alterations may precede the development of
significant stress-related psychiatric disorder
or disease (asthma, allergy, heart disease...).

**Please remember...in western
countries divorce of parental
couple is actually the first cause
of parental loss...**

**AND MORE OF TEN MILLIONS OF
EUROPEAN MINORS ARE
CHILDREN OF DIVORCED
COUPLES**

DIRECT ACTION ON CHROMOSOMES! Adverse childhood events are related to continued vulnerability among older adults enhancing the impact of chronic stress factors: it means more psychiatric disorders (for abuse has been demonstrated to lead to an increase of metabolic diseases, cancers, lung's diseases)

Childhood Adversity Heightens the Impact of Later-Life Caregiving Stress on Telomere Length and Inflammation

JANICE K. KIECOLT-GLASER, PhD, JEAN-PHILIPPE GOUIN, MA, NAN-PING WENG, MD, PhD, WILLIAM B. MALARKEY, MD, DAVID Q. BEVERSDORF, MD, AND RONALD GLASER, PhD

Objective: To address the question of whether childhood abuse and other adversities have lasting, detectable consequences for inflammation and cell aging late in life, and whether the effects are large enough to be discernible beyond that of a major chronic stressor, dementia family caregiving. Previous research on the physical health consequences of childhood abuse and other adversities has been based on data from young or middle-aged adults. **Method:** In this community sample of 132 healthy older adults (mean age = 69.70 years; standard deviation = 10.14), including 58 dementia family caregivers and 74 noncaregivers, blood samples were analyzed for interleukin (IL)-6, tumor necrosis factor (TNF)- α , and telomere length, a measure of cell aging. Depressive symptoms were assessed by the Center for Epidemiological Studies Depression Scale. **Results:** After controlling for age, caregiving status, gender, body mass index, exercise, and sleep, the presence of multiple childhood adversities was related to both heightened IL-6 ($0.37 \pm 0.03 \log_{10} \text{ pg/mL}$ versus $0.44 \pm 0.03 \log_{10} \text{ pg/mL}$) and shorter telomeres ($6.51 \pm 0.17 \text{ Kb}$ versus $5.87 \pm 0.20 \text{ Kb}$), compared with the absence of adversity; the telomere difference could translate into a 7- to 15-year difference in life span. Abuse was associated with heightened IL-6 and TNF- α levels; for TNF- α , this relationship was magnified in caregivers compared with controls. Moreover, abuse and caregiving status were associated significantly and independently with higher levels of depressive symptoms. **Conclusions:** Adverse childhood events are related to continued vulnerability among older adults, enhancing the impact of chronic stressors. Childhood adversities cast a very long shadow. **Key words:** psychoneuroimmunology, interleukin-6, tumor necrosis factor- α , depression, cell aging, trauma.

INFLUENCE ON HORMONAL ASSESSMENT

2012 Jan;15(1):1-10. Epub 2011 Jun 19.

Experience of stress in childhood negatively correlates with plasma oxytocin concentration in adult men.

Source

Department of Life Sciences, Roehampton University, London, UK.

Abstract

Early life experience is known to affect responses to stress in adulthood. Adverse experience in childhood and/or adolescence sensitises to life events that precipitate depression in later life. Published evidence suggests a relationship between depression and oxytocin (OT), but the extent to which early life experience influences OT disposition in adulthood deserves further exploration. This study hypothesised that early life stress (ELS) has a long-term negative effect on OT system activity. The study was performed on 90 male volunteers (18-56 years; mean $\pm$ standard deviation = 27.7 $\pm$ 7.09 years). Several questionnaires were used to assess: health, early life stressful experiences in childhood (ELS-C, up to 12 years) and early life stressful adolescence (13-18 years), recent stressful life events, depressive symptoms, state-trait anxiety and social desirability. Plasma OT concentration was estimated by means of a competitive enzyme immunoassay.

Lower OT concentrations were significantly associated with higher levels of ELS-C ($p < 0.01$), and with depressive symptoms and trait anxiety (both $p < 0.05$). The interaction between ELS-C and trait anxiety was significant ($p < 0.05$), indicating that the link between ELS-C and plasma OT concentration is moderated by trait anxiety. These results contribute to the evidence that early life adverse experience is negatively associated with OT system activity in adulthood, and offer further insight into mediator and moderator effects on this link.

Epigenetic regulation of the glucocorticoid receptor in human brain associates with childhood abuse

VOLUME 12 | NUMBER 3 | MARCH 2009 NATURE NEUROSCIENCE

Patrick O McGowan^{1,2}, Aya Sasaki^{1,2}, Ana C D'Alessio³, Sergiy Dymov³, Benoit Labonté^{1,4}, Moshe Szyf^{2,3}, Gustavo Turecki^{1,4} & Michael J Meaney^{1,2,5}

Maternal care influences hypothalamic-pituitary-adrenal (HPA) function in the rat through epigenetic programming of glucocorticoid receptor expression. In humans, childhood abuse alters HPA stress responses and increases the risk of suicide. We examined epigenetic differences in a neuron-specific glucocorticoid receptor (*NR3C1*) promoter between postmortem hippocampus obtained from suicide victims with a history of childhood abuse and those from either suicide victims with no childhood abuse or controls. We found decreased levels of glucocorticoid receptor mRNA, as well as mRNA transcripts bearing the glucocorticoid receptor 1_F splice variant and increased cytosine methylation of an *NR3C1* promoter. Patch-methylated *NR3C1* promoter constructs that mimicked the methylation state in samples from abused suicide victims showed decreased NGFI-A transcription factor binding and NGFI-A-inducible gene transcription. These findings translate previous results from rat to humans and suggest a common effect of parental care on the epigenetic regulation of hippocampal glucocorticoid receptor expression.

Figure 2 Methylation of the *NR3C1* promoter in the hippocampus. Twenty clones were sequenced for each subject for methylation mapping. (a) Mean $\pm$ s.e.m. percentage of methylated clones for suicide victims with a history of childhood abuse ($n = 12$), suicide victims without a history of childhood abuse ($n = 12$) and controls ($n = 12$). The methylation percentage was calculated as the number of clones with at least one methylated CpG site divided by the total number of clones (* indicates $P \leq 0.05$; n.s. indicates not statistically significant). (b) Methylation of the *NR3C1* promoter region, showing the frequency of methylation observed at each CpG site for suicide victims with a history of childhood abuse, suicide victims with no history of childhood abuse and control subjects (* $P < 0.05$, ** $P < 0.001$, abused suicides versus controls; & $P < 0.05$, && $P < 0.001$, non-abused suicides versus controls; # $P < 0.05$, ## $P < 0.001$, abused suicides versus non-abused suicides; Bonferroni *post hoc* comparisons).

NOW A QUESTION FOR THE PUBLIC: ARE THESE ONES
ARGUMENTS OF FAMILY RIGHT??

For sure pensions, alimonies, houses are arguments of Family
Right but not the behaviours to protect the children from organic
and non organic damages

FIRST TAKE-HOME MESSAGE:
CO-PARENTING IS NOT JUST A JURIDIC,
ANTROPOLOGICAL, SOCIOLOGICAL
CONCEPT ANYMORE... BUT MAINLY A
SCIENTIFIC ISSUE! SO WE CAN SAY
THAT THE COMPETENCE SHOULD BE
NOT ONLY OF JUSTICE COMMISSIONER
BUT OF HEALTH COMMISSIONER...

Unfortunately...“The definition of joint custody belongs to substantive family law. As such, it does not fall within the EU's competence but remains under the sole responsibility of the Member States. This explains why there may be differences in the national systems as regards the definition of joint custody and how it works in practice”.

7 March 2013 E-000713/2013

Answer given by Mrs Reding on behalf of the Commission

**I DON'T AGREE!! IN PRINCIPLE IT'S A QUESTION OF HEALTH AND
EUROPE HAS COMPETENCE IN THIS AREA**

SECOND TAKE-HOME MESSAGE: PARENTAL LOSS AND PSYCHOLOGICAL STRESS CAN CAUSE ORGANIC DAMAGE, not only untangible pain.

PARENTAL LOSS CAN HAVE DRAMATIC CONSEQUENCES BUT... SHARED-EQUAL CUSTODY WOULD BE A GOOD INSTRUMENT TO PREVENT PARENTAL LOSS

Less frequent loss of father-child contact when the residences are near (loss in 33% when they are more than 400 kms each other distant and in 81% when the father is not able to answer about the duration of the trip)

Less frequent loss of father-child contact after alternating residence (1% vs. 21% in maternal custody)

Number 500 • May 2013 • *Population & Societies* • Monthly bulletin of the French National Institute for Demographic Studies

Before going to examine the european situation, I tried to determinate if shared custody is in the paramount interest of the children.

In fact...

While during the '60-'70-'80s the discussion on alternating custody was based on theoretic models, by the end of '90 the scientists have begun to work on tangible features.

It was finally possible study quite wide casistics of children living in equal-alternating custody!

THIRD TAKE-HOME MESSAGE: after more than 40 years since the debate began, we could now substitute the theoretical and ideological debate with a more concrete and practical approach based on research findings (especially meta-analysis). This allows for the evaluation of the experience of countries that have, unlike Italy and most of southern countries, an established history of joint-alternating custody.

COUNTRIES WITH ESTABLISHED HISTORY OF JOINT-ALTERNATING CUSTODY? FOR EXAMPLE

Official national statistics of Quebec reported in 2006 that 29,66% of children (11-14 years old) of separated couples spent 40 to 60% of the time with each parent

In Sweden, about 28% of children from separated couples spent in 2009 about 50% of the time with each parent *Lundstrom, K. (2009) Växelvis boende ökar bland skilsmässobarn, Välfärd, 4, 3-5.*

In Wisconsin about 22% of children lived in 2008 50-50 and 32% more than 30% of time by parent 2

Melli, M. & Brown P.R. (2008) Exploring a new family form – The shared time family, International Journal of Law, Policy and the Family, 22

In Washington State 16% of children lived 50-50 and 34% spent more than 35% of time by parent 2 *George, T. (2008) Residential Summary Time Reports filed in Washington from July 2007 – March 2008, Washington State Centre for Court Research: Administrative Office of the Courts.*

In my first research I grounded on studies
1-published on scientific reviews of international
repute

2-widespread enough to allow a statistical
evaluation

3- without geographic connotations (not only USA)
4-possibly with metanalytic features
(critical analysis of other researches)

It involves more than 200.000 children

Robert Bauserman, Health Department USA,
Maryland - 2002: "Child Adjustment in Joint-Custody
Versus Sole-Custody Arrangements: A Meta-Analytic
Review," Robert Bauserman, Ph.D., AIDS
Administration/Department of Health and Mental
Hygiene; Journal of Family Psychology, Vol 16, No. 1.

It compares 1846 sole custody vs. 814 joint-
alternating custody (at least 25% spent by parent 2)

Seven measured parameters: :

1-general psychic assessment

2-behavioral adjustment

3-emotional adjustment

4-self esteem

5-family relationships

6-academic performances

7-psychic wellness until the divorce

*Globally examined and compared (between 1982 and 1999)
1846 children in sole custody and 814 in joint custody (time spent
with parent 2 from 25% to 50%)*

Bauserman metanalysis included 33 researches

4 comparing sole versus alternating custody

21 comparing physical joint custody (25% to 50% of the time) versus sole custody

6 comparing sole custody versus joint custody with times unspecified but according to common definition of the parents

2 comparing alternating versus joint custody

1-The "joint custody" gave in the children better outcomes independently from external variances and identity of the person completing the measure (fathers, mothers, teachers, physicians, psychologists etc) **WITH STATISTICAL VALIDATION**

2- A –the parental conflict was smaller between the groups in joint custody

B –a lower conflict between the parents couldn't allow to foresee a better assessment.

What was very important seemed to be the joint custody, not the low level of the conflict.

The comparison between physical joint custody and children with intact families didn't show any difference (qualitative or quantitative)

Beata Jablonska B.Sc – Lindbergh Risk behaviours, victimisation and mental distress among adolescents in different family structures
Social Psychiatry and Psychiatric Epidemiology
August 2007, Volume 42, Issue 8, pp 656-663

Postive influences (in 15.428 children 11-13-15 years old) about use of drugs, alchool, smoke, mental distress and victimisation -measured by experiences of exposure to bullying and physical violence-

Best outcomes of equal co-parenting had been (with statistical validation) on mental distress.

Sweden statistics 2009. Survey of the swedish gouvernement

<http://www.socialstyrelsen.se/publikationer2012/2012-5-15>

Less risks for children in alternating domicile compared with children with other kinds of custody about:

Bullying

Lack of satisfaction about the school

Psychic disease

Low quality of life (they are richer than the counterparts)

AUSTRALIA: co parenting and shared custody when the parents don't agree became first option in 2006: in few years equal custody reached 16% of the children

Effects on conflicts are
evident: the claims to Family
Court decreased suddenly:

Year	Family Court	Federal Magistrates
2003-04	45,004	70,261
2004-05	37,394	73,853
2005-06	35,066	73,287
2006-07	27,313	76,807
2007-08	20,337	77,169
2008-09	18,633	79,441

Life Satisfaction Among Children in
Different Family Structures: A Comparative
Study of 36 Western Societies

(184.496 minors in Austria, Belgium, Bulgaria, Canada, Croatia, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Israel, Italy, Lettonia, Lithuania, Luxembourg, Macedonia, Netherlands, Norway, Poland, Portugal, Romania, Russia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, Ukraine, United Kingdom, and the United States) CHILDREN & SOCIETY VOLUME 26,
(2012) pp. 51–62

This paper examines differences in life satisfaction among children in different family structures in 36 western, industrialised countries (n = 184 496).

Children who lived half the time with their mother in one household and half the time with their father in another household were classified as living in joint physical custody.

1- Children living with both biological parents reported higher levels of life satisfaction than children living with a single parent or parent–step-parent.

2- Children in joint physical custody reported significantly higher levels of life satisfaction (CLOSE TO INTACT FAMILIES'S CHILDREN) than their counterparts in other types of non-intact families.

LESS THAN 16% BETWEEN 16% AND 20% OVER 20%

THIRD TAKE HOME MESSAGE: it seems –
especially in mediterranean area- that there exists a
thick wall between the world of the Science and the
world of the Right.

Less evident in Scandinavia or USA (Washington,
Wisconsin, California) where the scientific outcomes
enter more easily the Courts and the judges love a
more practical and less theoretical approach.

FOURTH TAKE HOME MESSAGE: European children are treated too differently according to their nationalities and the legal system they are subjected to.

It is necessary to make practices more harmonised by taking example from most advanced countries.

Considered the consequences on children's psychological and physical health, this might be possible only by replacing the dominant "sectionalist" legal language with a more universal scientific language allowing all children to have an equal right to health.

But the juridical language dominates...

EUROPEAN COMMISSION

DIRECTORATE-GENERAL JUSTICE

Directorate C: Fundamental rights and Union
citizenship

The Director

Brussels

JUST/C1 /MT/vh/1249852s

Within the policy framework of the 2011 Communication "An EU Agenda for the Rights of the Child"¹ and with the support of the European Parliament, on 1 September 2012, the European Commission has launched a **study to collect data on children's involvement in judicial proceedings (administrative, civil and criminal justice) in the 27 EU Member States and Croatia.**

The study will run from **September 2012 to September 2014** to establish statistics and collect data based on structural, process and outcome indicators on children involved in criminal, civil and administrative judicial proceedings for the years 2008-2010 (and 2011 if available) for all 28 countries in order to provide

Children involved in parental divorce proceedings

Number of children involved in parental divorce proceedings during a 12 month period

Rate of children involved in parental divorce proceedings (per 100,000 child population 0-17 years) during a 12 month period

Custody awards to a sole parent

Number of custody awards to a sole parent, disaggregated by mother/father during a 12 month period

But the problem is not only the sole custody or the legal joint custody... these are formal features. In fact...

The problem, the core is the time:

“Children do not care if their parents adopted joint custody, sole custody, parental responsibility. Children only care about the amount of time they will be allowed to spend with their parents after divorce”
J. García Sanchez.

Example:

Italy (89%) and Sweden (93%) have the same rate of legal joint custody but about 30% of swedish children live 50-50 by their parents after divorce (only 2% in Italy...)

Our judiciary systems move for (or behind) the
paramount interest of the children but often
we ask spontaneously ourselves :
«How was this paramount interest defined in
the beginning ?»

Following the scientific evidences, the stranger
experiences, the international literature?
FIFTH TAKE HOME MESSAGE:FOR SURE NOT,
BECAUSE EVERY SYSTEM CHOOSES A
DIFFERENT PARAMOUNT INTEREST!!

Or following the old habits, the
personal opinions, the
prejudices, the ideologies?
IN ITALY WE HAVE FOUND 57
KINDS OF PRE PRINTED
SCHEDULES ORIENTEERING THE
DIVORCE WHEN THE COUPLE
DIDN'T ENTER THE COURT YET!

Esempio 1 – Tribunale di Civitavecchia

Il Presidente (1)

Dato atto di quanto sopra, decide in via provvisoria:

- 1) autorizza i coniugi a vivere separati;
- 2) affida la casa coniugale al _____ con la facoltà per _____ di prelevare gli effetti personali entro trenta giorni da oggi;
- 3) affida il minore alla _____ con la facoltà per il padre di vederlo e tenerlo con sé;
- 4) stabilisce che il marito versi alla moglie, per il mantenimento della stessa e dei figli _____,

Esempio 3 – Tribunale di Brescia

RICORSO PER SEPARAZIONE CONSENSUALE DEI CONIUGI

2. I figli vengono affidati congiuntamente ad entrambi i genitori, con residenza presso la madre che si occuperà della ordinaria amministrazione;
3. Il padre li vedrà quando lo desidera, previo accordo, e li terrà con sé ogni settimana il giorno _____ dall'uscita della scuola fino alle ore _____ (con pernottamento _____)
4. Il padre verserà alla moglie, a titolo di contributo per il mantenimento dei figli minori, un assegno mensile di € _____ (Euro _____)

But almost all the western
world plays the same role
when we talk about male
parenting

The difference is in the courage of
admission:

A governative report has highlighted that french judiciary system shows index of discrimination of parents according the sex:
the report talks even about dissuasion to fatherhood!

<http://www.ladocumentationfrancaise.fr/var/storage/rapports-publics/114000300/0000.pdf>

The report claims that, although the law on joint custody, only 14% of minors has physical joint custody and only 7% of custodies is granted to fathers

And (for example) in Italy??
Alternating custody under 2%

sole custody for fathers
0,8% after the separation
and 1,9% after the divorce

<http://www.istat.it/it/archivio/66665>

What do the children think?

YOUNG ADULTS' PERSPECTIVES ON DIVORCE Living Arrangements

William Fabricius and Jeffrey Hall 2000, Univ.Arizona
Family And Conciliation Courts Review, 38 (4): 446-461,
2000

820 respondents wanted to have spent more time with
their fathers as they were growing up,

The living arrangement they believed was best was living
equal time with each parent (93% between young who had
experimented, 70% between other ones).

The thoughts of children according to italian judges:

The children, especially teenagers, are lazy and they prefer one living reference point; even more because they don't have the same personal belongings in both the houses.

(Official document of Upper Council of Magistracy

<http://www.minoriefamiglia.it/download/RELAZIONE%20CSM%208%20MARZO%20AFFIDAMENTO%20CONDIVISO%20e%20ESCLUSIVO%2027%20marzo.pdf>)

So personal belongings... are worth more than one parent.
